

Carbon Neutral Vision of Nippon Steel

NIPPON STEEL
Green Transformation
initiative

September 2nd, 2024
Clean Coal Day International Meeting

NIPPON STEEL CORPORATION

Ironmaking by iron ore reduction is necessary² for the future

To make steel products, either iron ore (iron oxide) must be reduced or scrap (after reduction) must be recycled.

Scrap generation increases with steel stocks.

- However, even in 2050, global scrap generation is expected to remain at about 50% of crude steel production, and the iron ore reduction process will continue to be essential.

Gap between global scrap generation and crude steel production

Steelmaking by scrap recycling alone cannot meet the world's steel demand
(This situation will be the same in 2050.)

From a volume perspective, it is essential to produce and use **iron ore-reduced steel**.

Source: JISE, Long-term vision for climate change mitigation: A challenge towards zero-carbon steel

Reduction is an essential process in extraction of Iron from its ores³

In nature, iron exists as oxides, iron ore. To produce steel products, oxygen must be removed (= reduced) from iron ore.

Reduction by carbon (coal)

- Mass productive
- Stable in proficiency
- Cost competitive

Reduction by hydrogen

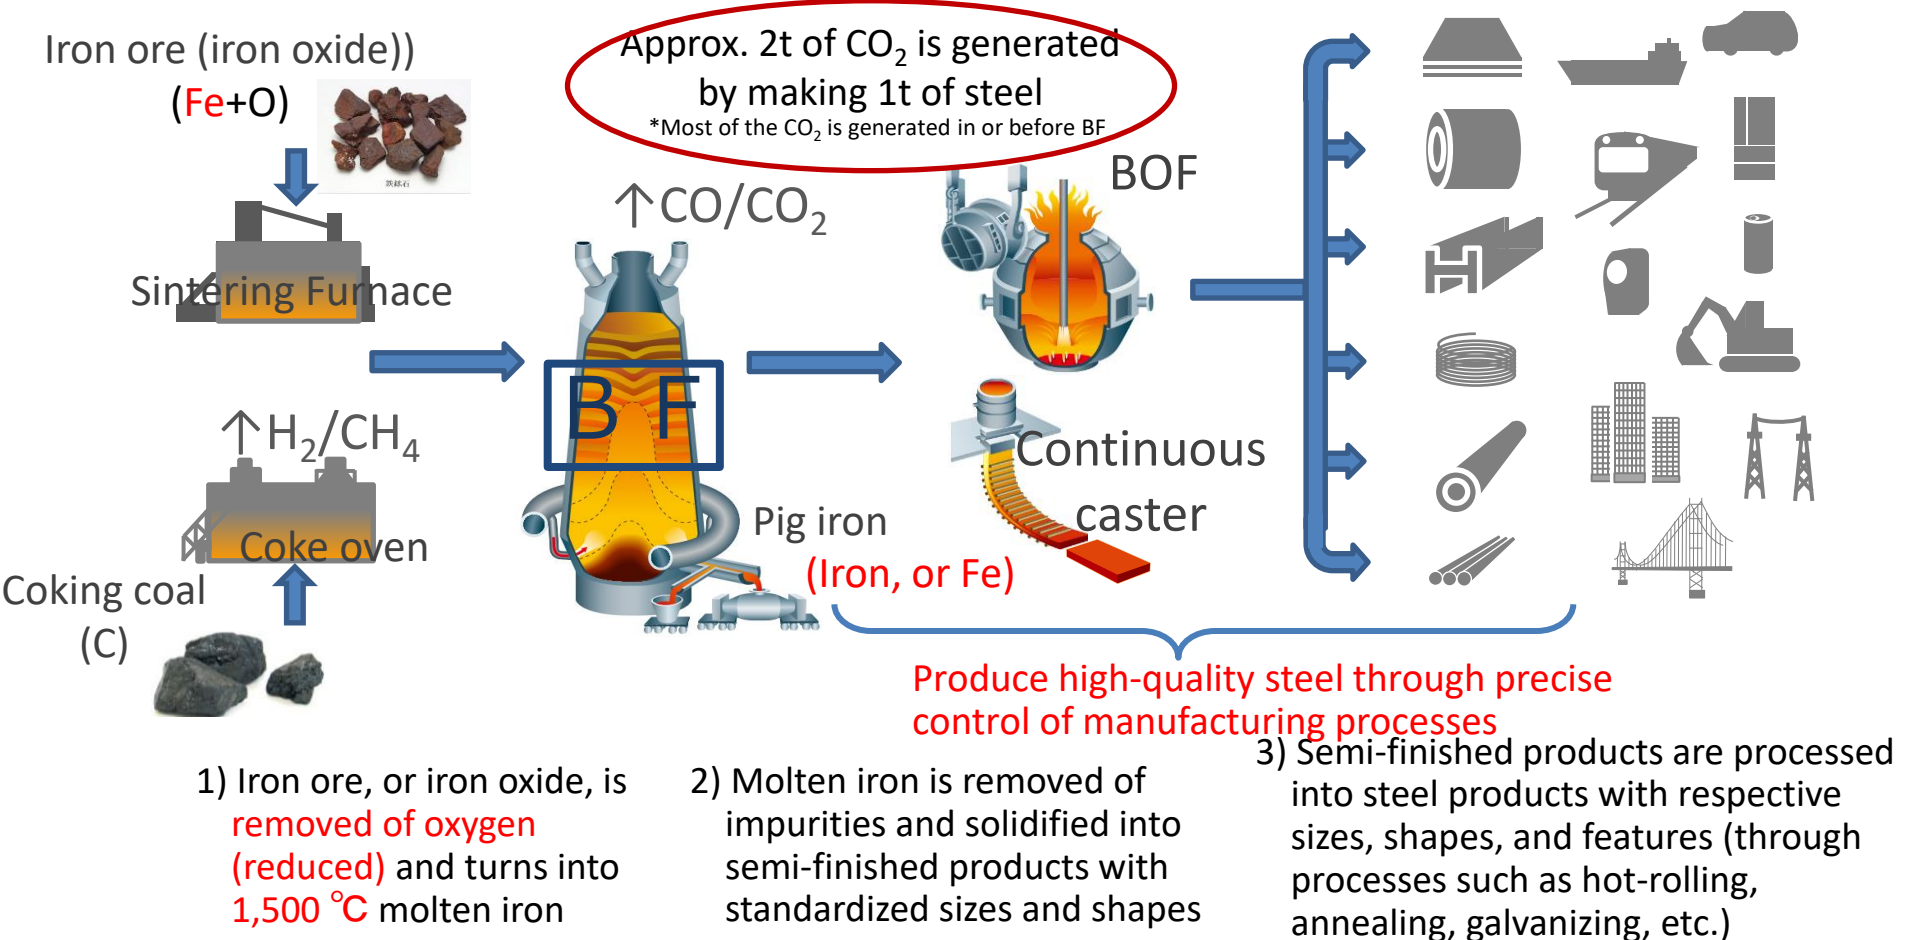

Challenge:

- CO_2 -free process

Process for reducing iron ore : Blast Furnace(BF) Method Features

- Currently, BF method is the only process in which **high-grade steel can be mass-produced from iron ore**.
- Unlike many other manufacturing industries where respective products are processed in dedicated lines, in steel industry all products share the same upstream line and diverge into different product lines.
- **BF method is extremely efficient system** where the by-product gas generated in iron ore reduction and melting by coking coal can be reused as energy source (heat, electric power, etc.) for the integrated steel making processes

Carbon Neutral Vision 2050

5

Released in March 2021

<Aim to reduce CO₂ emissions by 30% by 2030 and achieve carbon neutrality by 2050>

Our 2030 target is ambitious compared to those of our global peers, and is feasibly aligned with the Japanese government's plan

Provision of high-performance steel products and solutions that contribute to reducing CO₂ emissions in society

Reduce CO₂ emissions at the time of production and processing by customers

Reduce CO₂ emissions at the time of use of our products by end customers

Decarbonization of steelmaking process for providing carbon neutral steel

Reduce CO₂ emissions in customers' supply chains

By providing high-performance steel products and solutions, and by decarbonizing steelmaking process ahead of other countries, we are determined to provide carbon neutral steel to our customers (including approximately 6,000 companies in Japan) and support their international competitiveness. From September 2023, we will launch sales of NSCarbolex[®] Neutral, a steel product that is certified as reducing CO₂ emissions by a third-party organization.

Make Our Earth Green

Carbon Neutral Process

Challenges of Hydrogen Utilization in Blast Furnaces

1. Current blast furnace operation with coke (coal)

- Reducing agent and Source of heat
- Support of raw materials at high temperature, maintaining gas flow in the furnace

*Gas from blast furnace is utilized as an energy source.

2. Technical Challenges in Hydrogen Conversion

Reduction
with
carbon

- Generating **CO₂**
- Due to the exothermic reaction, 1) the reaction is sustained and 2) the iron is melted at high temperature, and the composition can be easily adjusted

Reduction
with
hydrogen

- Generating **H₂O (steam)**
- Due to the **temperature drop in the furnace**, 1) the reaction is not sustained and 2) produced iron does not melt

⇒Challenge:
Injection hydrogen at high temperature (with explosion risk)

Challenges of 100% hydrogen use in direct reduction

Currently, high-grade ores used as raw materials for reduced iron are scarce, accounting for only about 5% of total iron ore production, and a shift to reduced iron production using low-grade ores is essential.

We are challenging to develop technology for a direct reduction process that uses low-grade ore as raw material and 100% hydrogen instead of methane (natural gas) as the reducing material.

Problems

- In addition to the issues of the existing DRI process,
- 1) Hydrogen reduction is endothermic.
→ **Hydrogen preheating to be required.**
 - 2) Powdering of raw materials at low temperature and sticking of products.
→ Less powdering and less sticking ore (only 10% of commercially available ores) to be fed, **so usage restrictions of raw materials are greater than BF method.**

Challenge

Technologies for blowing a large amount of preheated flammable gases at high-temperature into the furnace, and expanding ores applicable to the hydrogen process

Carbon Neutral Vision 2050

9

To realize carbon neutral

Three Factors to increase costs

- a) Huge R&D costs
- b) Huge CAPEX
for practical implementation
- c) Increase in operational cost

- Financial support for R&D and practical implementation
- Equal-footing in international competition

Support for every single step of Initiatives
from R&D to social implementation

a) R&D

b) Practical
implementation

c) Electricity &
Hydrogen Cost

d) Raw
materials

Green Innovation Fund adoption

11

GI fund Use of hydrogen in steelmaking process

GI fund	As of Dec., 2021	Addition ~Mar. , 2024.3	Total
	193.5 Bn.	+ 256.4 Bn.	= 449.9 Bn.

R&D Item #1

Development of hydrogen injection into BF's

(1)Development of hydrogen reduction technology utilizing on-site hydrogen

$$14.0 \text{ Bn.} + 29.6 \text{ Bn.} = 43.6 \text{ Bn.}$$

(2)Development of low-carbon technology utilizing hydrogen from external sources and CO₂ contained in BF gas

$$121.4 \text{ Bn.} + 117.2 \text{ Bn.} = 238.6 \text{ Bn.}$$

R&D Item #2

Development of hydrogen direct reduction technology: low-grade iron ore reduction only by using hydrogen

(1)Development of direct hydrogen reduction technology

$$34.5 \text{ Bn.} + 79.6 \text{ Bn.} = 114.1 \text{ Bn.}$$

(2)Development of impurity removal technology for EAFs using direct reduced iron

$$23.6 \text{ Bn.} + 7.0 \text{ Bn.} = 30.6 \text{ Bn.}$$

(3)Development of technologies such as high-efficiency melting by an electric melting furnace using directly reduced iron

$$23.0 \text{ Bn.} = 23.0 \text{ Bn.}$$

(unit: JPY)

Corresponding technologies that NSC has been pushing forward

**COURSE50 BF****SUPERCOURSE50 BF****100% hydrogen use in direct reduction process (shaft furnace etc.)****Production of high-grade steel in large size EAFs****Electric Melting Furnace**

GI (Green Innovation) Fund : A government fund to provide continuous support to companies and others committed to ambitious goals to achieve carbon neutrality by 2050, from R&D and demonstration to social implementation, for a period of 10 years.

3 challenges for achieving a carbon-neutral society

12

Technology development

- Discovery of technology development seeds and securing of budget (completed)
- A development project is underway

Predictability of investment recovery

- Technical review for implementation (in progress)
- **Determine the predictability of investment recovery and strategic significance**, including government support and green steel market formation
- Green steel market formation
Turning the **environmental value** (CO2 reduction) to the **economic value**

Infrastructure

- **Electric Power System Reform (7th Strategic Energy Plan)**
Comprehensive power supply and demand measures and safe utilization of nuclear technology
- **Social implementation of hydrogen, ammonia, and CCUS**

Efforts to surmount the 3 challenges

Lobbying to the entire society, with a focus on making policy and institutional proposals to the government and industry

Technology development	Gov't support in development planning and testing	Green Innovation (GI) Fund "Utilization of hydrogen in the steelmaking process" “ ¥193.5 bln ➔ Raised to ¥449.9 bln	...	Budgeting completed
	Gov't support for capital expenditures	One-third of the total investment borne by the government by use of GX Transition Bonds	...	Institutionalization completed
Predictability of investment recovery	Gov't support for operating costs	Establishment of a strategic materials and production base tax system (Green Steel)	...	Institutionalization completed
	International standardization	Adoption of the mass balance method at Worldsteel and development of guidelines Lobbying for revision of ISO, GHG protocol, etc.	...	High-level agreement in principle
	Creation of economic value from the environmental value (CO ₂ reduction)	GX League [Ministry of Economy, Trade and Industry] ➔ Growth-oriented carbon pricing GX Product Market Study Group [Ministry of Economy, Trade and Industry] and the Government GX Implementation Committee Exchange of opinions with the automobile industry and others	...	Start of discussion on GX market creation
	Energy infrastructure development	Safe use of nuclear and other energy sources for the 7th Strategic Energy Plan Hydrogen and Ammonia: Revised Basic Hydrogen Strategy, Hydrogen Society Promotion Law CCS: JOGMEC/Advanced CCS Support Program	...	Committee recommendations
Infrastructure			...	Bill passed
